

Births per year (thousands)

The children they had

Each ribbon shows the same births counted two ways: by calendar year (top, "Births per year") and by mother's birth cohort (bottom, "The children they had"), colored by the standard deviation of age at childbearing (legend, right) — darker bands mark more concentrated childbearing ages, paler bands more dispersed ones. The meandering white centerline tracks the crude ratio of each cohort's completed births to same-year births, curving up through generational growth and down through contraction.

Data: Human Fertility Database (HFD) births/ASFR/exposure series for Spain, 1922–2023, compiled from INE Vital Statistics; extended through 2078 with an illustrative de Beer (1985/1989) fertility–rate projection holding the female population at its 2023 age structure.
